Security Awareness Guide

Essential knowledge to protect yourself and your organization from phishing attacks

Why Phishing Awareness Matters

Over 90% of successful cyber attacks start with a phishing email. Attackers don't hack systems — they trick people. This guide helps you recognize, report, and resist phishing attempts in your daily work.

What is Phishing?

Phishing is a type of social engineering attack where criminals send fake emails, messages, or create fake websites that look like they come from trusted sources. Their goal is to trick you into revealing sensitive information like passwords, credit card numbers, or personal data.

information like passwords, credit card numbers, or personal data.

Common Types of Phishing

1

Email Phishing

Mass emails impersonating banks, tech companies, or your own organization

2

Spear Phishing

Targeted emails using your name, role, or personal details to seem legitimate

3

Whaling

Attacks targeting executives and senior management for high-value access

4

Smishing & Vishing

Phishing via SMS text messages or phone calls

5

Clone Phishing

Copies of real emails you've received, with malicious links swapped in

How to Spot a Phishing Email

- 1 Urgency & Threats**
"Your account will be locked in 24 hours!" — Attackers create panic so you act without thinking.
- 2 Suspicious Sender**
Check the actual email address, not just the display name. Look for misspellings like support@amaz0n.com.
- 3 Generic Greetings**
"Dear User" or "Dear Customer" instead of your actual name.
- 4 Suspicious Links**
Hover over links before clicking. The URL should match the claimed sender's domain.
- 5 Requests for Sensitive Info**
No legitimate company asks for passwords, OTPs, or SSNs via email.
- 6 Grammar & Spelling Errors**
Professional organizations proofread their emails. Errors are a red flag.
- 7 Unexpected Attachments**
Don't open attachments you weren't expecting, especially .exe, .zip, or macro-enabled files.

What to Do If You Suspect Phishing

1

Don't Click

Never click links or download attachments from suspicious emails.

2

Report It

Forward the email to your IT security team or use the "Report Phishing" button.

3

Verify Independently

Contact the sender through a known, trusted channel — not through the email.

4

Delete the Email

After reporting, delete the email from your inbox and trash.

Do's

Verify sender email addresses carefully

Hover over links before clicking

Report suspicious emails to IT security

Use multi-factor authentication on all accounts

Keep software and browsers up to date

Use unique, strong passwords for every account

Be cautious with unexpected attachments

Verify requests through a separate communication channel

Don'ts

Don't click links in unexpected emails

Don't share passwords or OTPs via email

Don't download attachments from unknown senders

Don't respond to urgent threatening emails immediately

Don't use the same password across accounts

Don't trust emails based on display name alone

Don't bypass security warnings from your browser

Don't provide sensitive info on unfamiliar websites

 **Password Security Best Practices**

1

Use Unique Passwords
Never reuse passwords across different accounts.

2

Enable MFA/2FA
Multi-factor authentication adds a critical extra layer of security.

3

Use a Password Manager
Tools like Bitwarden, 1Password, or LastPass generate and store strong passwords.

4

Never Share Passwords
IT will never ask for your password. Anyone who does is suspicious.

 **For Organizations & Security Teams**

1

Regular Training
Conduct phishing awareness training at least quarterly.

2

Simulated Phishing
Run internal phishing simulations to test and improve employee awareness.

3

Clear Reporting Process
Make it easy for employees to report suspicious emails.

4

Email Filtering
Deploy advanced email security gateways and DMARC/DKIM/SPF records.

5

Incident Response Plan
Have a documented plan for when phishing attacks succeed.
